AI-Assisted Work Instruction Migration

ProcessIQ
UNIFIED MANUFACTURING INTELLIGENCE

ProcessIQ eradicates one of the major barriers to MES adoption.

ProcessIQ's AI Ingestion module streamlines the migration of PDF based legacy work instructions into digital, structured processes ready for the shop floor. AI removes 90% of the manual rework that normally stands in the way.

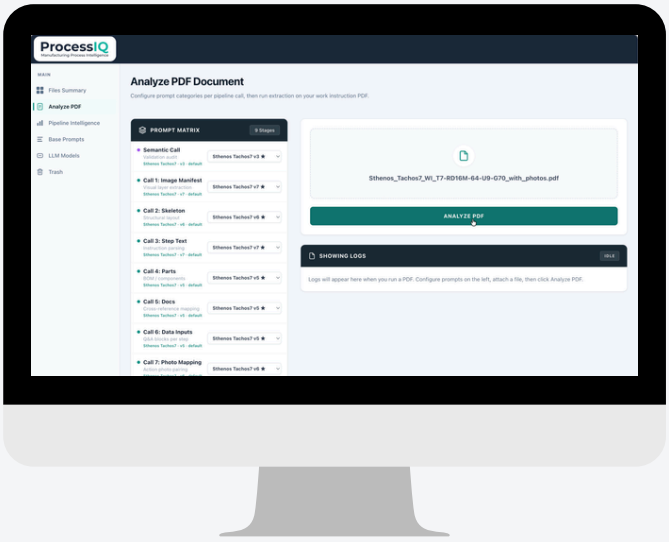

ProcessIQ provides an AI-assisted work instruction build process for legacy processes contained in Word, Excel, or other siloed digital documents. Migrating these documents into digital steps can be costly, time-consuming and intimidating.

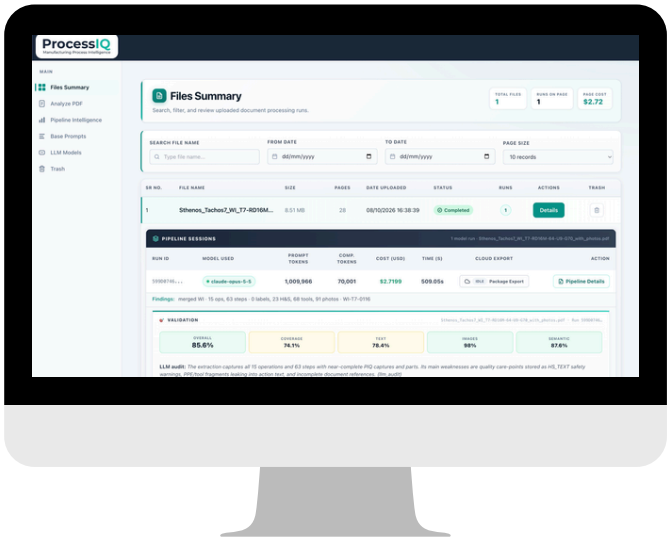

But with ProcessIQ, AI does the heavy lift without taking away the control and human approval, significantly reducing one of the critical bottlenecks of implementing a new MES system.

STEP 1

PDF work instructions are uploaded into ProcessIQ AI Ingestion module, where AI interprets the data.

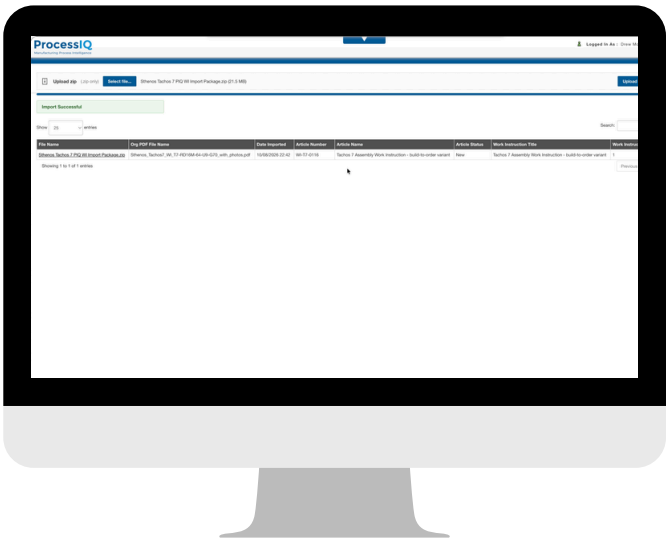

AI creates the ProcessIQ structured work instruction, including images, tools, steps, health & safety, etc.

AI quality checks data to identify potential gaps or errors.

ProcessIQ keeps you in control of cost and performance.

STEP 2

The new digital work instruction is packaged up, then uploaded into ProcessIQ, ready for human validation and approval.

STEP 3

Follow your usual approval process to validate the work instruction.

Publish, then your legacy work instruction is transformed into a ProcessIQ digital workflow.
